

Write a function called `isStrongPassword()` in `script.js` that has a single password parameter. The function should return true only if all the following conditions are true:

- The password is at least 8 characters long.
- The password does not contain the string "password".
- The password contains at least one uppercase character.

If any of the above conditions are false, `isStrongPassword()` should return false.

Below are example calls to `isStrongPassword()`:

```
isStrongPassword("Qwerty");           // false - Too short
isStrongPassword("passwordQwerty")    // false - Contains "password"
isStrongPassword("qwerty123")         // false - No uppercase characters
isStrongPassword("Qwerty123")         // true
```

To test your code in your web browser, call `isStrongPassword()` from the JavaScript console.
