Different resolutions for different DPRs

Modify the first `<img>` in egypt.html to use the `srcset` attribute. Show egypt_600.jpg on a 1 DPR screen, egypt_1200.jpg on a 2 DPR screen, and egypt_1800.jpg on a 3 DPR screen.

The Chrome DevTools' Network tab can be used to verify that the appropriate image is requested depending on the DPR. Ex: The screenshot below shows egypt_1200.jpg is requested when the DPR is 2.0.

Different image sizes for different viewport widths

Modify the second `<img>` in egypt.html to use the `srcset` and `sizes` attributes.

Hints: (Refer only if required)

The `srcset` attribute should indicate the image names and associated sizes:

- luxor_600.jpg is 600 pixels wide
- luxor_800.jpg is 800 pixels wide
- luxor_1200.jpg is 1200 pixels wide

The `sizes` attribute should describe the image size requirements for various viewport widths:

- When the viewport width is at least 700px wide, the image width should be 600px.
- When the viewport width is at least 500px wide, the image width should be 400px.
- The default image width should be 200px.

Resizing the browser width should cause the three different images to display at the 500 and 700 breakpoints.

Art direction for different viewport widths

Add `<picture>` tags around the third `<img>` in egypt.html. Then add the appropriate tag inside `<picture>` so hotel_wide.jpg is displayed instead of hotel_narrow.jpg when the viewport width is at least 500px wide.

Resizing the browser should display hotel_narrow.jpg when the viewport width is < 500px wide and hotel_wide.jpg otherwise.

SVG image for list background

Modify styles.css so check.svg is displayed centered in the background of the unordered list. Set the following CSS properties:

Hints: (Refer only if required)

- `background-image` should display check.svg
- `background-repeat` should be `no-repeat`
- `background-position` should be `center`
- `background-size` should be 60vw

Resizing the browser width should cause the check.svg image to grow and shrink.
